Daily Deluge of Data

Today, we are awash in a daily deluge of data.

- It's constantly growing.
- It's constantly changing.
- Some is structured.
- Some is unstructured.
- Some is semi-structured.

Piling up data is easy.

Gaining insight from the data pile is hard.

This is one of many challenges of Big Data.

Structured Data

Some data is structured.

	doctor unknown	did integer	is_treating unknown	pid integer
1	doctor	1	is treating	0
2	doctor	1	is treating	2
3	doctor	1	is treating	3
4	doctor	1	is treating	4
5	doctor	1	is treating	5
6	doctor	1	is treating	6
7	doctor	1	is treating	7
8	doctor	1	is treating	9
9	doctor	1	is treating	10

73	doctor	47	is treating	55
74	doctor	49	is treating	64

[Un | Semi] structured Data

Some data is unstructured or semi-structured.

Graph Structured Data

Virtually all data (structured, unstructured, and semi-structured) can be modeled as a network.

A network, or **graph**, is a collection of dots (“vertices”) and lines (“edges”) connecting those dots.

A graph with six (6) vertices and seven (7) edges

A graph with 63 vertices and 62 edges

Graph Structured Data

Graphs can show multi-dimensional relationships that are difficult to see in other data models.

	doctor unknown	did integer	is_treating unknown	pid integer
1	doctor	1	is treating	0
2	doctor	1	is treating	2
3	doctor	1	is treating	3
4	doctor	1	is treating	4

73	doctor	47	is treating	55
74	doctor	49	is treating	64

The same data set shown at left as a graph, and at right as tables of rows and columns.

Big Data Challenges

Big Data is always **Growing**

- more sources
- more products and services
- more messages
- more transactions

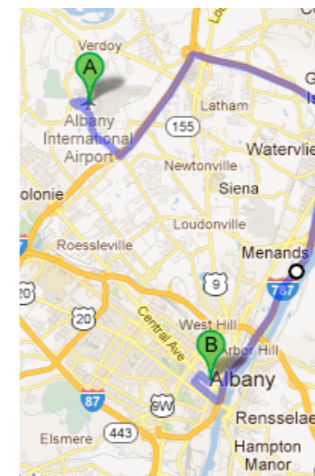

Big Data is always **Changing**

- adding, removing, and modifying connections

In other words . . .

Big Data is always **Evolving**

Q: How do we gain insight from evolving networks?

Dynamic Graphs

A: We gain insight from evolving networks by treating them like Dynamic Graphs where vertices (dots) model entities and edges (lines) model relationships between entities.

The evolution of a network can be modeled as a **series of graphs** that represent that network at different points in time.

Dynamic Graphs are Everywhere

Understanding dynamic graph evolution enables applications in many areas, among them:

- Social and Business networks
- National Security
- Marketing
- Transportation
- Pharmacology
- Communications networks
- Financial networks
- Social Contact analysis
- Sensor networks

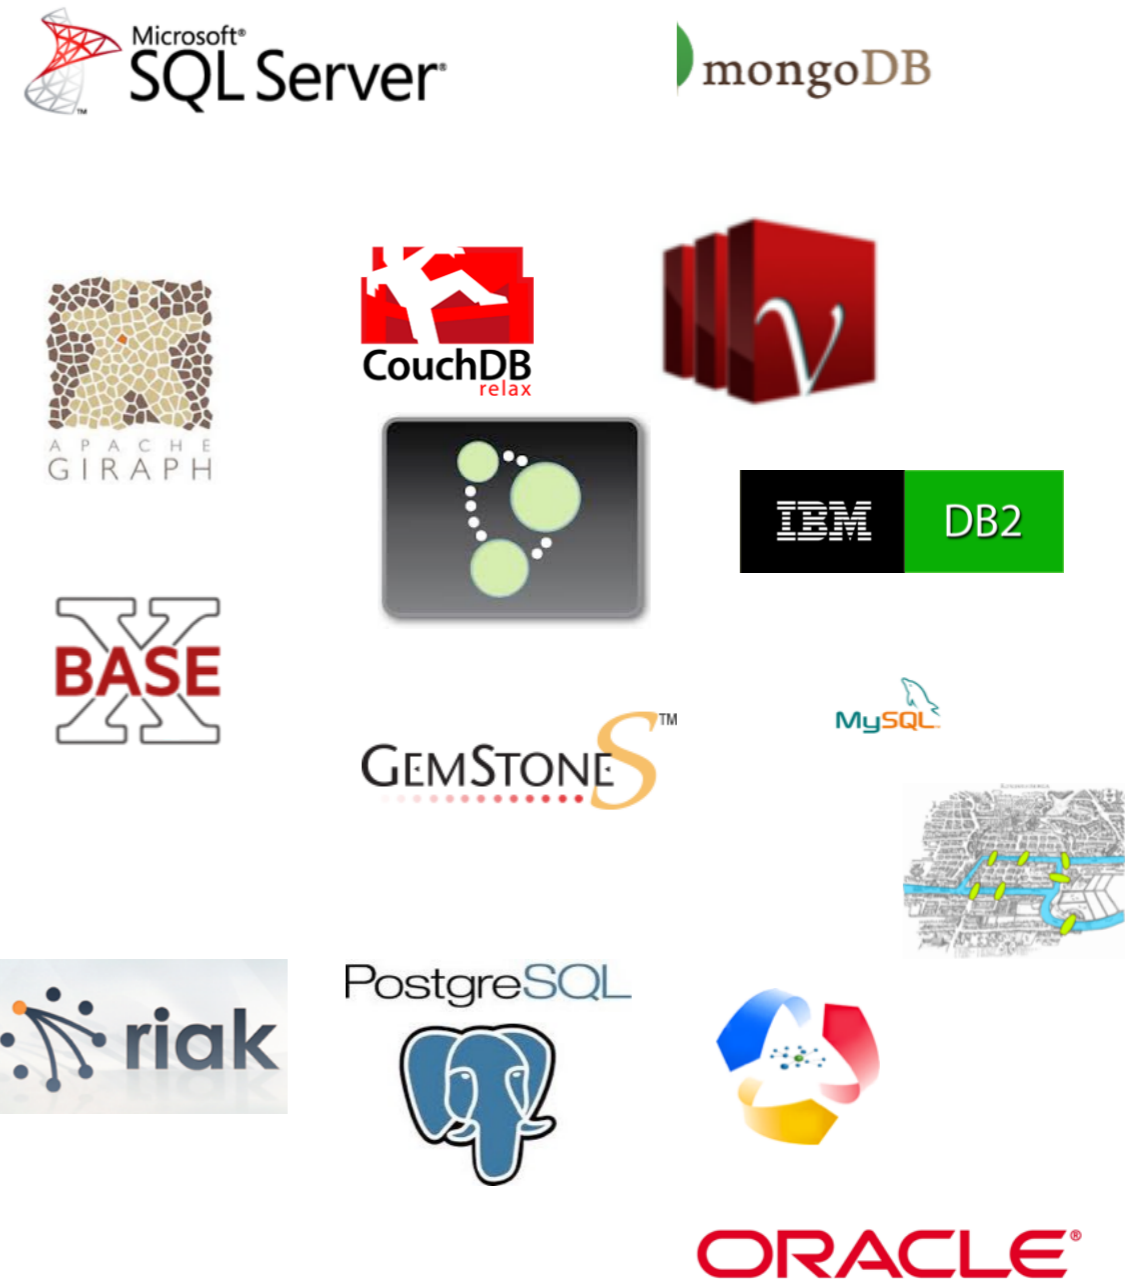

How do we gain insight?

So Many Systems

So many tools.

Which can provide insight into evolving networks?

So Many Systems

Non-relational systems do not effectively address these challenges.

NoSQL schemes, **XML** files, **object** repositories, **document** collections, and **key-value** stores are too unstructured to be reliably queried and often require task-specific code to support accurate analysis.

None of these approaches embrace graph theoretic models. As a result, graph analytics requires custom programming.

Many Systems

Relational systems do not effectively address these challenges.

Relational database systems require breaking down graph structures into separate entities for vertices and edges.

Graph analysis in this scheme involves costly join and self-join operations (the vertices table to itself, through the edge table) for every “hop” from a source vertex to a destination.

PostgreSQL

ORACLE

A Few Systems

Current graph systems do not effectively address these challenges.

Today's **graph** systems are designed for **one operation** on **one graph** at a time.

Pregel (Google), Trinity (Microsoft), Giraph (open source), Neo4j (open source), GPS (Stanford), and others store and analyze one graph at a time, thus missing the complexity and subtlety inherent in network evolution.

No Systems?

It gets worse.

None of the aforementioned systems take advantage of commonalities in their data storage and processing. With petabyte-scale data, duplication is a deal-breaker.

If only there were a dynamic graph database that could conveniently and efficiently store series of large graphs while supporting diverse operators for queries, aggregates, indexing, and filtering.

G*The Dynamic Graph Database

- Conveniently and efficiently stores series of large graphs.
- Compresses graphs based on their commonalities.
- Supports diverse operators for graph, aggregate, indexing, and filtering.
- Accelerates complex queries on graphs using operators that share common results across graphs.

G* The Dynamic Graph Database

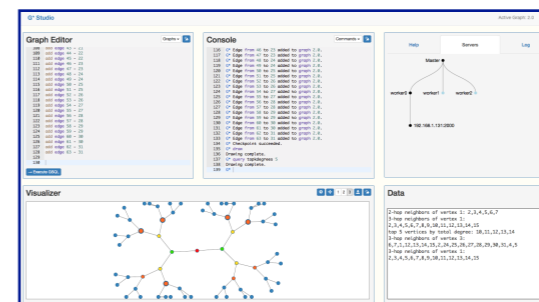

Summary

G* is a dynamic graph database system with many features.

- graph distribution
 - multi-core scale up
 - multi-server scale out
- deduplicated disk storage for very large graphs
- in-memory compact indexing
- shared computation
- easy use of sophisticated parallel graph-theoretic queries
- integrates with Relational databases and other stores

Analyzing evolving graphs enables applications in many areas.

- social media analysis
- network traffic threat assessment
- fraud detection
- marketing
- transportation
- epidemiology
- pharmacology
- . . .and many other areas

G* The Dynamic Graph Database

Browser Application

G* Studio Active Graph: 2.0 ✔

Graph Editor

```
108 aaa edge 45 - 21
109 add edge 44 - 22
110 add edge 45 - 22
111 add edge 46 - 23
112 add edge 47 - 23
113 add edge 48 - 24
114 add edge 49 - 24
115 add edge 50 - 25
116 add edge 51 - 25
117 add edge 52 - 26
118 add edge 53 - 26
119 add edge 54 - 27
120 add edge 55 - 27
121 add edge 56 - 28
122 add edge 57 - 28
123 add edge 58 - 29
124 add edge 59 - 29
125 add edge 60 - 30
126 add edge 61 - 30
127 add edge 62 - 31
128 add edge 63 - 31
129
130
```

→ Execute GSQL

Console

```
116 G* Edge from 46 to 23 added to graph 2.0.
117 G* Edge from 47 to 23 added to graph 2.0.
118 G* Edge from 48 to 24 added to graph 2.0.
119 G* Edge from 49 to 24 added to graph 2.0.
120 G* Edge from 50 to 25 added to graph 2.0.
121 G* Edge from 51 to 25 added to graph 2.0.
122 G* Edge from 52 to 26 added to graph 2.0.
123 G* Edge from 53 to 26 added to graph 2.0.
124 G* Edge from 54 to 27 added to graph 2.0.
125 G* Edge from 55 to 27 added to graph 2.0.
126 G* Edge from 56 to 28 added to graph 2.0.
127 G* Edge from 57 to 28 added to graph 2.0.
128 G* Edge from 58 to 29 added to graph 2.0.
129 G* Edge from 59 to 29 added to graph 2.0.
130 G* Edge from 60 to 30 added to graph 2.0.
131 G* Edge from 61 to 30 added to graph 2.0.
132 G* Edge from 62 to 31 added to graph 2.0.
133 G* Edge from 63 to 31 added to graph 2.0.
134 G* Checkpoint succeeded.
135 G* draw
136 Drawing complete.
137 G* query topkdegrees 5
138 Drawing complete.
139 G*
```

Servers

```
graph TD
  Master((Master)) --- worker0((worker0))
  Master --- worker1((worker1))
  Master --- worker2((worker2))
  worker0 --- IP[192.168.1.131:2000]
```

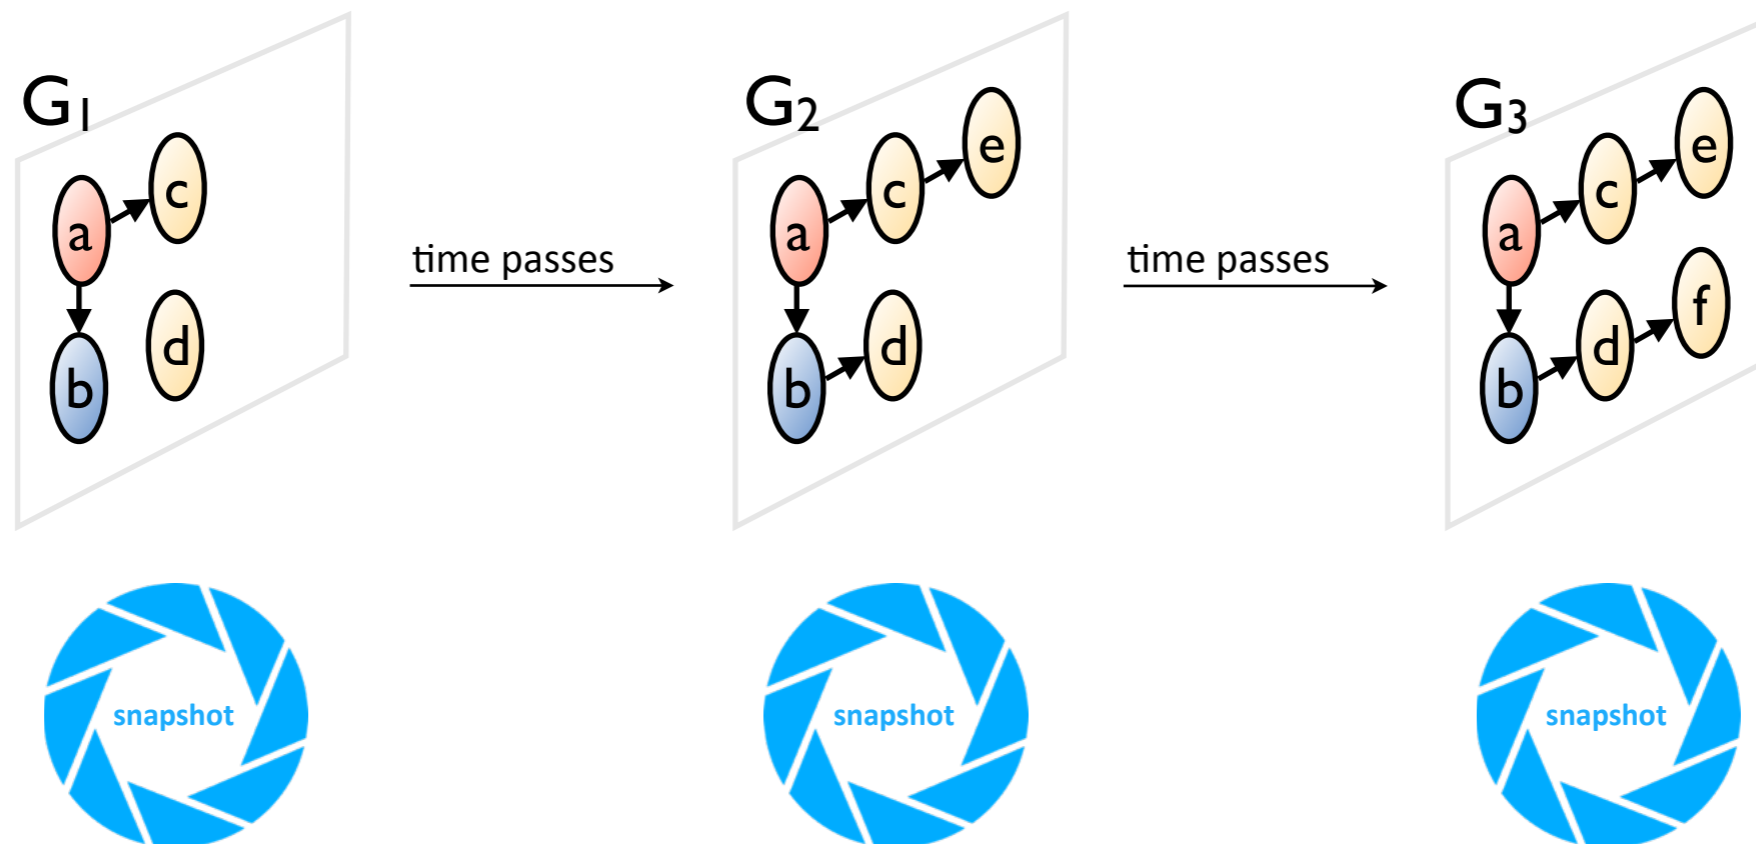

Visualizer

Data

```
2-hop neighbors of vertex 1: 2,3,4,5,6,7
3-hop neighbors of vertex 1:
2,3,4,5,6,7,8,9,10,11,12,13,14,15
top 5 vertices by total degree: 10,11,12,13,14
3-hop neighbors of vertex 3:
6,7,1,12,13,14,15,2,24,25,26,27,28,29,30,31,4,5
3-hop neighbors of vertex 1:
2,3,4,5,6,7,8,9,10,11,12,13,14,15
```
